AI Use Case Identifier

Pre-meeting briefs for AI consulting with SMEs
Ironhack Project 3 · LangGraph MVP

Problem and user

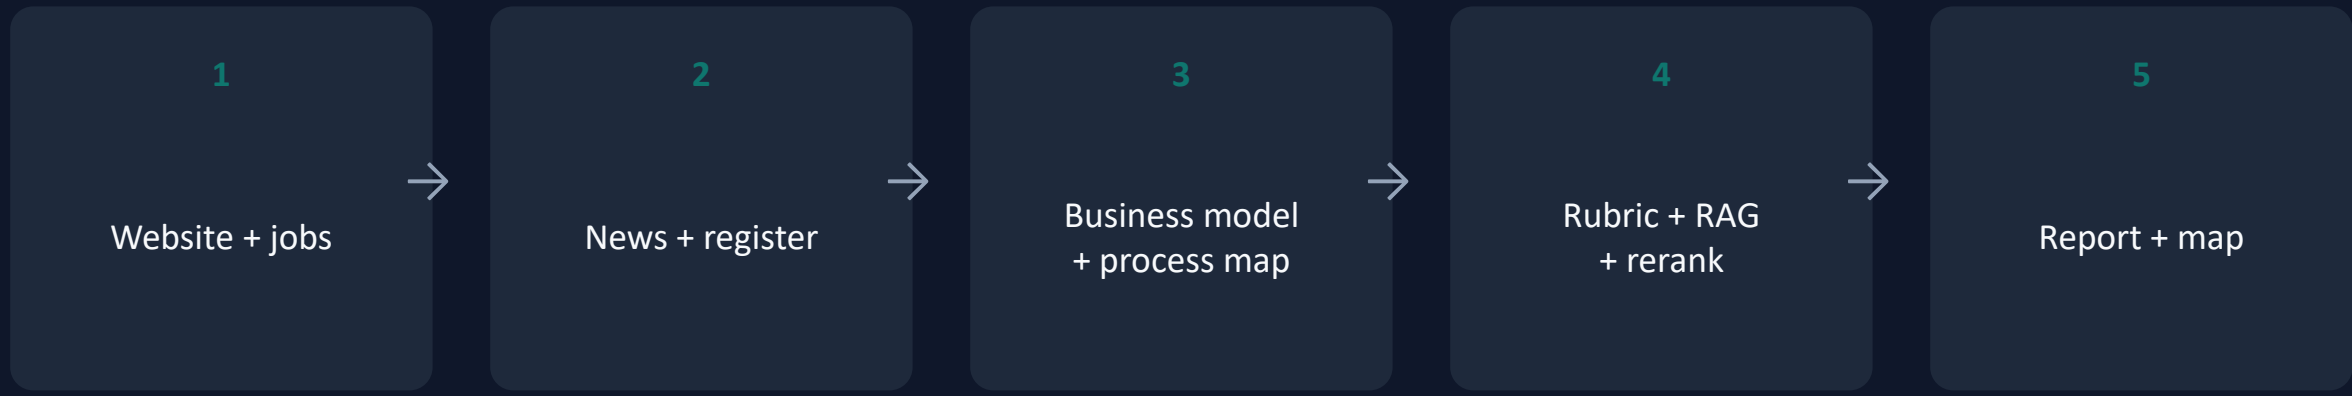

The problem

SMEs want AI, but consultants spend the first meeting guessing the business model, processes, and where AI could help. Generic use-case lists do not stick.

The user

An AI consultant preparing a first conversation with a German SME — later the same brief can be a lead magnet for owners and MDs.

Autonomy: one command → report

```
python -m app.run --company "KoRo" --url "https://www.korodrogerie.de"
```

The report: useful before the meeting

Company + process map
Documented vs assumption, unit economics

Three use cases
Change process first → AI assist → pilot

Redesign + Option B
Augment people, speculative bigger bet

Meeting questions
General discovery + case-specific checks

Why LangGraph (not n8n for this MVP)

- Shared typed state: research → model → picks → report
- Rules in code: evidence ids, quick win + redesign, retrieved cards only
- RAG + company-fit rerank inside the match node
- n8n stays secondary: templates feed the library; later webhook/UI

GTM: next three sprints

Sprint 1

Brief for email

30 requests · 25% book a call

Sprint 2

Validate questions

7/10 calls decide on a use case

Sprint 3

Vertical workshop

2 paid workshops booked

Demo + backup

Live: python -m app.run …
Backup: samples/koro.md + process-map.png
